

Generalization Vs Specialization

- Common thing in both is that they are in the form of Hierarchy.
- Names - Parent Class, Child Class
Or Base Class, Derived Class
Or Super Class, Sub Class

★ Generalization - Group of classes are referred with Super class with single name.

- It means Bottom Up.
- In Generalization, a Super Class is made by ~~avoiding~~ Grouping Multiple Sub Classes.
- It is achieved using Interfaces.
(Abstract Classes are also used)

★ Specialization - A new sub-class is generated by borrowing the features of existing concrete class & adding new features to it.

- It means Top Down.
- A new class is derived from an existing super class.
- Achieved using Inheritance.

Inheritance - The process of acquiring features of an existing class into a new class.

- Class will have properties & methods.
- extends is the keyword used for Inheritance.
- Derived class is also known as Specialized class.
- Constructors are executed from Top to Bottom in Inheritance.

Date _____

★ METHOD OVERRIDING - Redefining the method of Super class in the Sub class.

- Method will be called depending on the object. (Achieved in Inheritance)
