

★ DYNAMIC DISPATCH METHOD - When a super class reference holding the object of sub class & overridden method is called then method of object will be called. It is Dynamic Dispatch Method.

- Useful for achieving Runtime Polymorphism.
- A Super Class Reference can hold the Object of Sub Class but it can call only those methods which are present in Super Class.
- Methods are called depending on the object, not the Reference.
- Dynamic Method Dispatch means calling a Method dynamically because program make the decision at runtime for which object to be called.
