

★ Strict/Proper/Full Binary Trees - It is a full binary tree if every node has 0 or 2 children. We can also say a full binary tree is a tree in which all nodes except leaf nodes have 2 children.

Ex.

$$\log_2(n+1) - 1 \leq h \leq \frac{n-1}{2}$$

Same $\Rightarrow e = i + 1$

- When h is given,
 - Max^m. nodes for strict binary tree - $2^{h+1} - 1$
 - Min^m. nodes for strict binary tree - $2h + 1$
- When n is given,
 - Min^m. Height $(h) = \log_2(n+1) - 1$
 - Max^m. Height $(h) = \frac{n-1}{2}$
